

INSTALL & CONNECT GUIDE · VERSION 1.0

Priyatham Health

Your personal companion for water, workouts, rides, meals, prep alarms, sleep and screen time, on your OnePlus Nord CE4 with your two laptops.

What's in this guide

1. How everything connects
2. Install the app on your OnePlus phone
3. First-time setup and permissions
4. OnePlus battery settings (important)
5. Set up ActivityWatch on laptop 1 and laptop 2
6. Connect the laptops to the app
7. Using the app every day
8. How alarms ring, vibrate and notify
9. Backups and updates
10. Troubleshooting

1 • How everything connects

Everything is stored **on your phone**. There is no account, no cloud and no sign-in. The laptops only share screen-time data with your phone when both are on your home Wi-Fi.

2 Install the app on your OnePlus phone

The app is a file called `PriyathamHealth-v1.0.apk`. It's in your **Google Drive** and in `Documents\PriyathamHealth` on this laptop.

- 1 On your phone, open the **Google Drive** app and find **PriyathamHealth-v1.0.apk** (use the search bar).
- 2 Tap it, then tap **Download** (or the : menu → **Download**). When it finishes, tap the download notification, or open it from the **Files** app → **Downloads**.
- 3 Android says *"For your security, your phone is not allowed to install unknown apps from this source."* Tap **Settings** → turn on **Allow from this source** → go back.
- 4 Tap **Install**. If Google Play Protect shows *"Unsafe app blocked"* or *"App scan recommended"*, tap **More details** → **Install anyway**. This appears because the app isn't from the Play Store. It's your own app.
- 5 Tap **Open**. You'll see the Priyatham Health logo, then the welcome screen.

Tip

After installing, you can switch **Allow from this source** back off for Drive/Files (Settings → Apps → Special app access → Install unknown apps).

3 First-time setup

- 1 **Welcome screen:** check your name (Priyatham), then add sex, age, height, weight and goal weight. Set your wake-up, sleep, work and workout times. Every reminder is timed from these.
- 2 **Set up your phone:** tap **Allow** on each row until all show **On**. Some rows open an Android settings page. Switch the app on there, then press Back.
- 3 Tap **Test alarm**. In 5 seconds it rings with the full-screen alarm. Put the phone on **silent** and test again: it **vibrates** instead of ringing.
- 4 Tap **Start using the app**. Your water, stand-break, workout, bedtime, check-in, weekly planning and weigh-in reminders are now scheduled.

Permission	Why the app needs it
Notifications	Every reminder shows as a notification with buttons (Done, Snooze, +250 ml).
Alarms & reminders (exact alarms)	Rings at the exact minute, even when the phone is idle.
Full-screen notifications	Shows the big ringing alarm screen over the lock screen.
Ignore battery optimisation	Stops OnePlus from closing the app, which would silence your alarms.
Physical activity	Counts steps with the phone's built-in step sensor. No watch needed.
Location (while using)	Records outdoor rides: distance, speed, route and climb.
Usage access	Reads your phone's screen time per app. It never leaves your phone.

4 OnePlus battery settings (don't skip)

OxygenOS closes background apps aggressively to save battery, and that can silence reminders. Do all three:

- 1 **Settings** → **Apps** → **App management** → **Priyatham Health** → **Battery** (or *Battery usage*) → choose **Unrestricted / Allow background activity**. Also turn on **Allow auto-launch** if you see it.
- 2 **Settings** → **Battery** → **More settings** → **Optimise battery use**: find Priyatham Health and set it to **Don't optimise**. (The in-app "Ignore battery optimisation" button does this too.)
- 3 Open **Recent apps**, press and hold (or swipe down on) the Priyatham Health card and tap **Lock**. A lock icon appears, so "Clear all" won't close it.

If reminders ever stop

Open the app once. It re-schedules everything on launch and after every phone restart. Then re-check the three settings above, because OnePlus system updates sometimes reset them.

5 Set up ActivityWatch on your laptops

ActivityWatch is **free and open source**. It records which apps and websites you use on a computer and keeps the data on that computer. Do these steps on **laptop 1**, then repeat them on **laptop 2**.

5a - Install it

- 1 Go to **activitywatch.net** → **Download** → **Windows** (the installer `.exe`).
- 2 Run the installer and accept the defaults. Tick **start on login** if asked, so it runs every time the laptop starts.
- 3 Start **ActivityWatch** from the Start menu. A small ActivityWatch icon appears near the clock (click ^ to see hidden icons).
- 4 Check it works: open `http://localhost:5600` in a browser. You should see the ActivityWatch dashboard. After a few minutes of use it shows your apps.

Optional: website detail

Install the **ActivityWatch Web Watcher** extension for Chrome/Edge (linked on activitywatch.net) to see time per website, not only per browser.

5b · Let your phone read it (home Wi-Fi only)

By default ActivityWatch only answers the laptop itself. These steps let your phone ask for today's totals over your home Wi-Fi.

1 **Quit ActivityWatch:** right-click the tray icon → **Quit ActivityWatch**.

2 **Open its config file.** Press **Win + R**, paste the line below and press Enter (this is the standard ActivityWatch 0.13 server):

```
notepad %LOCALAPPDATA%\activitywatch\activitywatch\aw-server\aw-server.toml
```

3 Under `[server]`, change `#host = "localhost"` to the line below (remove the #), then **Save**:

```
[server]
host = "0.0.0.0"
```

Only if your laptop runs the Rust server instead (an `aw-server-rust` folder exists): edit `aw-server-rust\config.toml` and put `address = "0.0.0.0"` there.

4 **Allow it through the firewall.** Right-click Start → **Terminal (Admin)** or **Windows PowerShell (Admin)**, paste this and press Enter:

```
New-NetFirewallRule -DisplayName "ActivityWatch (home Wi-Fi)" -Direction Inbound -
Protocol TCP -LocalPort 5600 -Action Allow -Profile Private
```

5 **Mark your home Wi-Fi as Private:** Settings → Network & internet → Wi-Fi → click your network → **Network profile type: Private**.

6 **Start ActivityWatch again** from the Start menu.

7 **Find the laptop's IP address:** press **Win + R** → type `cmd` → Enter → type `ipconfig` → Enter. Under **Wireless LAN adapter Wi-Fi**, note the **IPv4 Address**, e.g. `192.168.1.20`.

8 **Test from your phone:** open Chrome on the phone (on the same Wi-Fi) and go to `http://192.168.1.20:5600` (your IP). If the dashboard opens, it's working.

Privacy note

The firewall rule only opens port 5600 on **Private** networks, so on café or office Wi-Fi (Public) the laptop stays closed. On your home Wi-Fi, other devices could read this laptop's activity summary too, so only do this on a network you trust.

Keep the IP from changing

Home routers sometimes give a laptop a new IP. In your router's admin page (often `192.168.1.1` or `192.168.0.1`), look for **DHCP reservation / Address reservation** and reserve the IP for each laptop. If you skip this and the laptop stops syncing, run `ipconfig` again and update the IP in the app.

6 Connect both laptops in the app

- 1 In the app, open **Insights** (bottom right) → tap + **Connect your 2 laptops** (or Settings → Laptops).
- 2 Name: **Laptop 1** (or something like "Work laptop"). IP: the IPv4 address from step 5b. Port: **5600**. Tap **Test & add**.
- 3 You should see "*Connected to <laptop name>*". Repeat for **Laptop 2**.
- 4 Back on **Insights**, pull the refresh button. Screen time now combines your **phone + laptop 1 + laptop 2**, split into work, leisure and other.

What you see in Insights	What it means
Total today	Phone + both laptops, only counting time you were actively using each laptop (AFK time is excluded).
Work / Leisure / Other	VS Code, Office, Teams, browsers = work. Instagram, YouTube, games, Netflix = leisure. Tap any app to change its category.
Phone after 11 pm	Late-night phone use. The app flags it because it directly hurts your sleep.
Is this healthy?	Flags leisure over 3 h, work screens over 9 h, and too few stand breaks.

When does laptop data update?

Whenever you open Insights while your phone and that laptop are on the same Wi-Fi and the laptop is awake. The last result is saved, so you still see it later.

7 Using the app every day

Tab	What to do
Today	Your day score (0–100) plus a timeline of everything: meals, prep steps, water, workout, check-in, wind-down. Gold = happening now, red dot = missed.
Move	Start a GPS ride, or play a routine with the voice-coach timer. Tap a routine to edit exercises, work/rest seconds and rounds. + New builds your own.
+ (gold)	Quick log: +250 ml water, food, weight, ride, workout, sleep check-in, stand break.
Meals	Weekly plan (breakfast / lunch / dinner). Tap a cell to pick a recipe. Gold-dot recipes have prep steps, and their alarms are set automatically.
Insights	Screen time (phone + laptops), plus links to Sleep, Weight & body, Water and Calories.

Weekend planning ritual

Every **Saturday 6 pm** an alarm reminds you to plan next week. Open **Meals** → **Next week**, fill the 21 slots (or **Copy previous week**), and check the **Shopping list**. That's it: every soak, grind and marinate alarm for the week is scheduled for you.

How prep alarms work (dosa example)

Your dosa recipe is: **soak rice & urad dal 6 h → grind → ferment 6 h = 12 h**. For **Monday 8:00 am breakfast**, with bedtime 11 pm and wake-up 7 am, the app counts back from the meal. Grinding at 2 am would fall in your sleep, so it moves grinding to before bed:

Step	First alarm	Final call	Then
Soak rice & urad dal	Sun 1:45 pm	Sun 4:45 pm	6 h soaking
Grind the batter	Sun 7:45 pm	Sun 10:45 pm	ferments overnight (6 h+)
Make dosa	Mon 8:00 am, batter ready		

Until you tap **Done**, the alarm repeats **every 15 minutes** and gets more urgent ("2 h 30 min left..."; "40 min left before the final call...") until the **FINAL CALL**. If you miss it, Today and Prep tasks show it in red with a **Change meal** button. Edit any recipe's steps and times in **Meals → Recipes**.

8 How alarms ring, vibrate and notify

Phone mode	"Alarm" reminders	"Notification" reminders	"Vibrate" reminders
Sound on	Ring with your alarm tone + full-screen alarm + notification	Normal notification sound	Vibrate + silent notification
Vibrate / Silent	Strong vibration (no sound) + full-screen alarm + notification	Silent / vibrate, as the phone decides	Vibrate + silent notification
Do not disturb	Alarms still come through	Held back	Held back

Choose the style for each type in **Settings → Alarms & reminders**. Defaults: cooking prep, workouts and weekly planning = **Alarm**; water, bedtime and check-in = **Notification**; stand breaks = **Vibrate**. Water nudges skip if you drank in the last 45 minutes, and each one has a **+250 ml** button right on the notification.

9 Backups and updates

- **Backup:** Settings → **Copy backup**, then paste it into a note or an email to yourself. On a new phone: Settings → **Restore** → paste.
- **Updates:** install a newer `PriyathamHealth-vX.apk` over the old one, and your data stays. Every version is signed with your private key, stored on this laptop at `C:\Users\priya\PriyathamHealth\android\app\priyatham-release.jks`. **Keep that folder safe:** Android only accepts updates signed with the same key.

10 Troubleshooting

Problem	Fix
Alarms don't ring on time	Section 4 (OnePlus battery). In the app: Settings → Phone permissions, and all rows should say On. Use Test alarm .
Alarm shows only a notification, no full screen	Settings → Apps → Priyatham Health → Notifications → allow full-screen notifications (the in-app "Full-screen alarms" button opens it).
Steps show 0	Allow Physical activity . Steps count from the first time you open the app each day, and a nightly snapshot keeps totals accurate.
Ride says "Finding GPS..."	Go outdoors, turn Location on, wait 10–30 seconds before starting. Set location permission to "Allow while using the app" with precise location on.
Laptop "Not reachable"	Both on the same Wi-Fi? Laptop awake and ActivityWatch running? Wi-Fi set to Private? Config has <code>address = "0.0.0.0"</code> and ActivityWatch was restarted? Firewall rule added? Try <code>http://IP:5600</code> in the phone's Chrome.
Laptop IP changed	Run <code>ipconfig</code> again, remove and re-add the laptop in the app, or set a DHCP reservation (section 5b).
Phone screen time empty	Allow Usage access : Settings → Apps → Special app access → Usage access → Priyatham Health → On.
Fonts look plain	The app's typefaces load from the internet the first time. Open it once while online.

Good to know

- Calorie and protein values are typical home-cooked estimates. Edit any food or create your own in **Food → Add → Create a food**.
- Ride calories use your weight and speed (standard MET values), so treat them as good estimates. Workout calories are rougher.
- Your targets: a gentle calorie deficit (about 0.25–0.5 kg a week), protein $\approx$ 1.6 g per kg of goal weight, water $\approx$ 33 ml per kg plus 500 ml on active days.
- This app gives general wellness guidance, not medical advice. See a doctor for anything that worries you.
